

Running routes assistant

Application which can find new walking/running based on points of interest

Goal:

- Better health
- Discover new places, culture

Technology used:

- Phone app / Smartwatch app
- Google maps
- Points of interest
- Route algorithm

Types of data:

- GPS coordinates
- User input: Run time / length they want

Pros:

- Easy to test
- More motivation to run
- Google maps and other maps have lots of existing data

Cons:

- Finite numbers of interesting places nearby

Feasibility:

- High

Music during sports / running

Transitions music based on pulse / running speed / training intensity. Looking at the user's music preferences and select the one that matches your training most. The assistant figures out when to change music. Looks at past history to see if changing music helps motivate.

Goal:

- Help the user get motivated and push further when running/training

Technology used:

- Smartphone app
- Spotify/Youtube/Soundcloud etc
- Accelerometer

Types of data:

- Pulse
- Accelerometer

Pros:

- Get more motivation and better health

Cons:

- Uncertain access to API of music streaming services
- Might be frustrating if a song is interrupted

Feasibility:

- High

House security system

Doorbell that can tell who is outside or whether it is a stranger. Facial recognition. Shows a picture on the app to the user and then they have to enter the name of that person. Next time it will show the name of the one outside.

Extra feature: opens door automatically

Goal:

Send a picture to your phone, give the person a name

Less likely to miss package delivery

Avoid unwanted visitors

Technology used:

Camera

Facial recognition

Types of data:

Pictures

Names

Pros:

Safety

Cons:

Misread people

Can't scan people with face coverings / hats

Unethical to take pictures of everyone coming to your house

Could make you look paranoid

Feasibility:

High

Driving concentration optimizer

Measure concentration in car. The sensors can be on the steering wheel. Warns at some point whether it is time for a break or food or similar.

Goal:

Warn if drivers if they are not concentrated. Make it more safe. Better health, when they eat and drink regularly. Prevent accidents due to fatigue.

Technology used:

Steering wheel

Watch

Phone app

Camera

Types of data:

Pulse

HRV

Face recognition

Sweat

GPS

Time

Pros:

Possibly less accidents

Learn more about yourself and your body

Cons:

Risky to test if driving

Could be annoying

Longer setup time

Feasibility:

Low

Assistant that scans mood and tries improving it

It looks at the pulse and the users music and saves the titles with most effect. It will scan platforms such as spotify, soundcloud and youtube
Another mood parameter it can look at is the user's habit requiring data from the user, if the user decides to write their habit down in a specific time interval the AI will figure out if the habit improves the mood.
The pc can use face recognition, to scan if the consumer's mood is improved by certain actions on the pc.

Goal:

Reduce stress, increase creativity or maybe used in some kind of meditation context.

Technology used:

Camera

Spotify/Youtube/Soundcloud etc

Types of data:

Facial-recognition

Pulse

Pros:

Get better mood

Mental health

Cons:

Mood is abstract and hard to collect from the user.

Less mobile if not laptop.

Requires PC to have webcam and have it on at all times.

Needs lots of user input and data

Feasibility:

Low
